Abstract:

New (pentulose- γ -lactone-2,3-enedibenzoate barbituric acid) (L) have been synthesized by reaction of (5-C-dimethyl malonyl-pentulose- γ -lactone-2,3-enedibenzoate) with urea in alkaline media (sodium methoxide). (Ca^{+2} , Co^{+2} , Ni^{+2} , Cu^{+2} , Zn^{+2} , Cd^{+2} and Hg^{+2}) complexes of (pentulose- γ -lactone-2,3-enedibenzoate barbituric acid) (L) have been prepared and characterized by (^1H and $^{13}\text{CNMR}$), FTIR, (U.V-Vis) spectroscopy, Atomic absorption spectrophotometer (A.A.S), Molar conductivity measurements and Magnetic moment measurements, and the following general formula has been given for the prepared complexes $[\text{MLCl}_2(\text{H}_2\text{O})] \cdot \text{XH}_2\text{O}$, where $\text{M} = (\text{Ca}^{+2}, \text{Co}^{+2}, \text{Ni}^{+2}, \text{Cu}^{+2}, \text{Zn}^{+2}, \text{Cd}^{+2}, \text{Hg}^{+2})$, $\text{X} = \text{five molecules with } (\text{Cd}^{+2})$ complex, L = (pentulose- γ -lactone-2,3-enedibenzoate barbituric acid).

Key words: dimethyl malonyl, pentulose, lactone, benzoate, barbituric acid, complexes.

Introduction

A variety of transition metal complexes with barbiturates have been prepared owing to their important roles in clinical detection and identification of drug[1-5]. Masoud[6] reported the synthesis of copper complexes with azobarbituric and azothiobarbituric acids. Also Mazharul[7] reported the synthesis of new ligands of macrocycle systems from the reaction of thiobarbituric acid with diethylenetriamine and diethyl oxalate. In this paper, properties of some new metal ions complexes with (pentulose- γ -lactone-2,3-enedibenzoate barbituric acid) (L) have been prepared.

Materials and Methods:

Metal salts ($\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$, $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$, $\text{NiCl}_2 \cdot 6\text{H}_2\text{O}$, $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$, ZnCl_2 , $\text{CdCl}_2 \cdot \text{H}_2\text{O}$ and HgCl_2) were obtained from Fluka,

Merck in high purity, Urea (Fluka), Sodium metal, Dimethyl malonate (BDH). (^1H and $^{13}\text{CNMR}$) spectra were recorded using Ultra Shield 300 MHz, Bruker, Switzerland, at University of Al al-Bayt, Jordan. IR spectra (in KBr discs) were recorded on Shimadzu FT Infrared spectrophotometer. The (U.V-Vis) were recorded using (Shimadzu U.V-Vis 160A), (U.V-Vis) spectrophotometer in dimethyl sulphoxide solution (10^{-3} M). Metal contents of the complexes were determined by Atomic absorption technique by using Shimadzu (AA680G) Atomic absorption spectrophotometer. The magnetic moments (μ_{eff} B.M) were calculated on Faraday method by using (Balance Magnetic Susceptibility Model MSBMKT). Melting points were determined by using (Stuart-melting point apparatus). Conductivity

*Department of Chemistry, College of Education / Ibn-Al-Haitham, Baghdad University

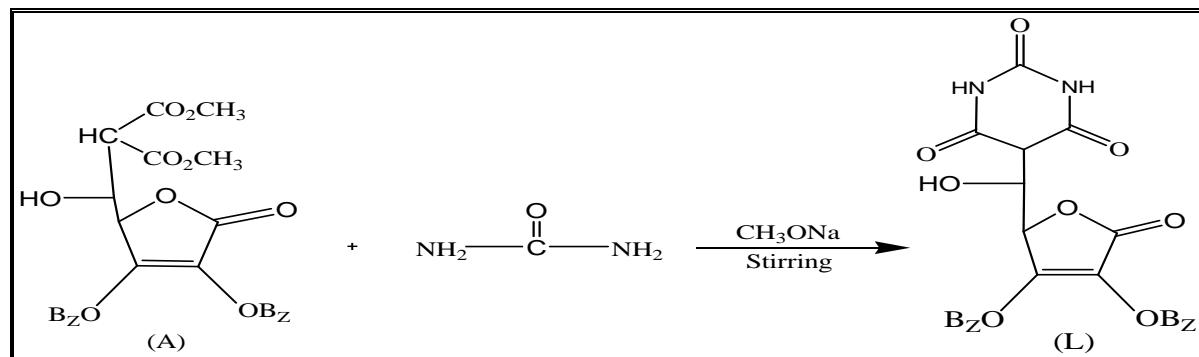

measurements were carried out using Philips PW.Digital.

Synthesis of ligand, (pentulose- γ -lactone-2,3-enedibenzoate barbituric acid)

1- Dry urea (15.5mmol) was added to solution of sodium methoxide (30.9mmol of sodium metal in absolute

methanol (20ml)), stirring at room temperature for 1 hour.

2- Solution of (5-C-dimethyl malonylpentulose- γ -lactone-2,3-enedibenzoate)[8] (A) (10.3mmol) in absolute methanol (30ml) was added, stirring was continued at room temperature for 48 hours. The solvent was evaporated; the combined residue was washed with hot absolute ethanol to give the white crystals, scheme (1).

Scheme (1) the synthesis route of ligand (L)

Synthesis of complexes

Addition of ethanol solution of the metal salts (Ca^{+2} , Co^{+2} , Ni^{+2} , Cu^{+2} , Z^{+2} , Cd^{+2} and Hg^{+2}) (1mmol) to solution of (L) (1mmol) distilled water. The mixture was stirring for 3 hours at room temperature, the resulting precipitates were filtered, washed and recrystallized from ethanol and dried in an oven at 50°C.

Results and Discussion:

The isolated complexes were crystalline solids, soluble in some of common solvents such as dimethyl formamide (DMF), dimethyl sulphoxide (DMSO). The conductivity measurements in DMSO indicated the non-electrolyte behavior; Table (1) includes the physical properties. The analytical data confirmed the (1:1) (Metal:Ligand) composition of the complexes. The magnetic measurements (μ_{eff} B.M) for the complexes are also listed in Table (1).

Table (1) Physical properties of ligand and its complexes

Formula	Colour	M.p°C or dec.	Metal % Found (Calc.)	Molar conductivity (S.cm ² mole ⁻¹) in DMSO (10 ⁻³ M)	μ_{eff} (B.M)

Spectral studies

¹H and ¹³CNMR spectra studies of the ligand (L):-

A) ¹HNMR spectrum for the ligand (L)

The ¹HNMR spectrum of (L), Fig. (1) showed the following signals: doublet (d) at δ (3) ppm for (1H, CH malonate), doublet (d) at δ (4.70-4.78) ppm for (1H, lactone ring H₄), and multiplet (m) at δ (7.25-7.73) ppm for aromatic protons.

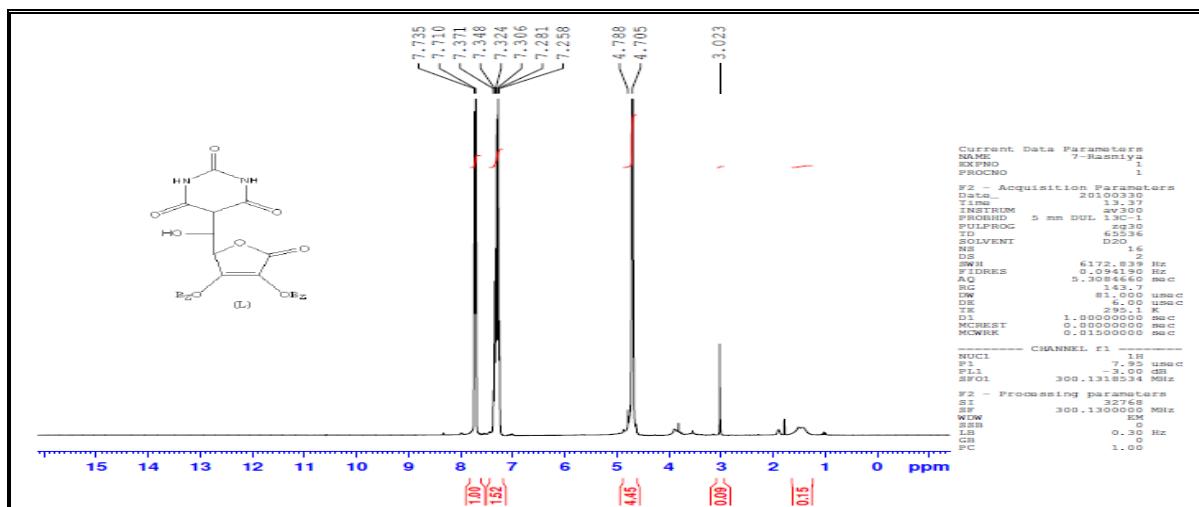

Fig. (1) ¹HNMR spectrum of ligand (L)

B) ¹³CNMR spectrum for the ligand (L)

The ¹³CNMR spectrum of (L), Fig. (2) showed the following signals:

signal at δ (177.53) ppm for carbon (C=O) in (HNCONH), signal at δ (175.65) ppm for carbon (C=O) in (CHCONH), signal at δ (164.53) ppm for carbon (C=O) of the ester, lactone

ring, signal at δ (136.14) ppm for C-3, signal at δ (131.63) ppm for C-2, signals at δ (131.24-127.85) ppm for

aromatic carbons, signal at δ (61.24) ppm for C-4, and signal at δ (47.85) ppm for C-5 and C-6.

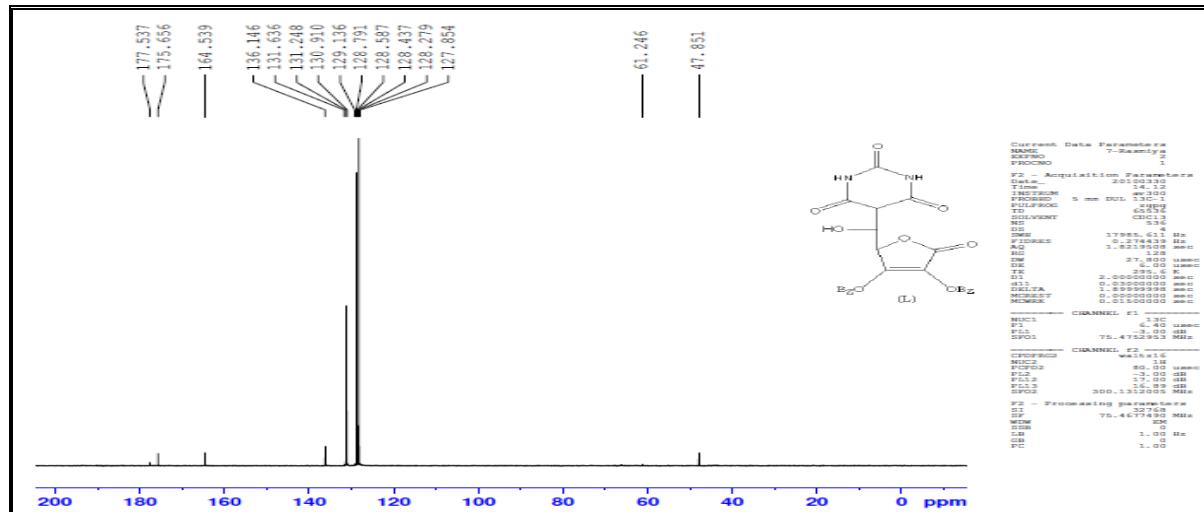

Fig. (2) ^{13}C NMR spectrum of ligand (L)

Infrared spectra

The important infrared spectra data of ligand (L) and its complexes are given in Table (2). The strong absorption band at $(1662)\text{ cm}^{-1}$ and $(1627)\text{ cm}^{-1}$ in the free ligand, Fig. (3) due to $\nu(\text{C=O})$ [9],[10], in the complexes spectra, this band has been found in the range between $(1600\text{-}1593)\text{ cm}^{-1}$ and $(1585\text{-}1550)\text{ cm}^{-1}$ shifted to lower frequencies by $(62\text{-}69)\text{ cm}^{-1}$ and $(42\text{-}77)\text{ cm}^{-1}$, which indicates the coordination of the oxygen atom at the $\nu(\text{C=O})$ group[11],[12].

In the free ligand, the band at $(3471)\text{ cm}^{-1}$ due to $\nu(\text{N-H})$, the spectra of the complexes show this band about $(3444\text{-}3390)\text{ cm}^{-1}$ shifted to lower frequencies by $(27\text{-}81)\text{ cm}^{-1}$ [13],[14].

The stretching vibration band $\nu(\text{C-N})$ observed at $(1346)\text{ cm}^{-1}$ in the spectrum of the free ligand, has been

found in the range $(1454\text{-}1400)\text{ cm}^{-1}$ shifted to higher frequencies on complexes formation by $(108\text{-}54)\text{ cm}^{-1}$, which indicates the coordination of the ligand (L) through the nitrogen atom of the aliphatic amine[15],[16]. New bands appeared in the spectra of metal complexes at $(678\text{-}470)\text{ cm}^{-1}$ and $(520\text{-}435)\text{ cm}^{-1}$ attributed to the (M-N) and (M-O) respectively[17],[18]. The bands are due to coordinate chloride ion in complexes formed with metal chloride were fall bellow the limits of our infrared spectrophotometer and could not be observed.

The spectra of complexes showed the appearance of bands in the range $(871\text{-}833)\text{ cm}^{-1}$ attributed to $\delta(\text{OH})$, these bands confirm the coordination of the water with metal[19]. Fig. (4) showed the infrared spectrum of nickel complex.

Table (2) the characteristic infrared of the ligand (L) and its metal complexes

Compound	$\nu(\text{N-H})$	$\nu(\text{C=O})$	$\nu(\text{C-N})$	$\delta(\text{OH})$	M-N	M-O
$\text{C}_{23}\text{H}_{16}\text{O}_{10}\text{N}_2$ [L]	3471(s)	1662(s) 1627(m)	1346(w)	-	-	-

Fig. (4) Infrared spectrum of $[\text{NiLCl}_2(\text{H}_2\text{O})]$

Electronic spectra

The absorptions and assignments related to the ligand and their complexes are listed in Table (3). The ligand (L), Fig. (5) exhibited an

absorption band in (U.V) region at (294) nm (34013) cm^{-1} which may be attributed to ($n \rightarrow \pi^*$) transition[9],[10].

Table (3) Electronic spectra data of (L) complexes in DMSO solvent

Compound	λ_{max} nm	Wave number cm^{-1}	ϵ_{max} molar $^{-1}\text{cm}^{-1}$	Assignment

Fig. (5) Electronic spectrum of ligand (L)

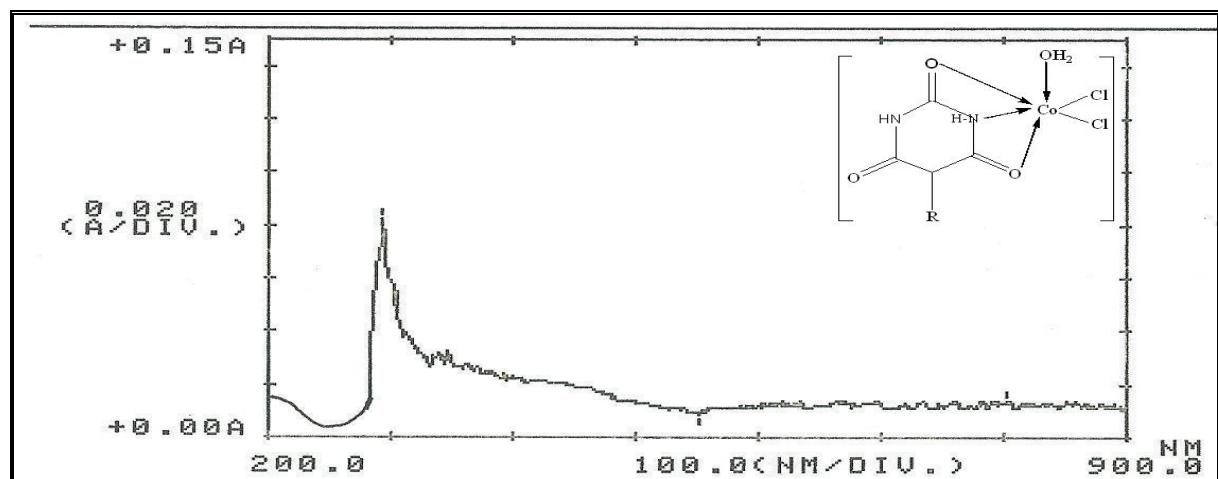

The spectra of complexes

- [CoLCl₂(H₂O)] complex

The spectrum of the brown complex of Co(II), Fig. (6) exhibited the following bands at (34246) cm⁻¹, (28571) cm⁻¹, (18148) cm⁻¹ and (12437) cm⁻¹ which have been assigned to (C.T), ${}^4T_{1g}(F) \xrightarrow{V_3} {}^4T_{1g}(p)$, ${}^4T_{1g}(F) \xrightarrow{V_2} {}^4A_{2g}$

and ${}^4T_{1g}(F) \xrightarrow{V_1} {}^4T_{2g}$ respectively[20].

The Racah interelectronic repulsion parameter (\dot{B}) found to be (627.2) cm⁻¹, the ratio $\beta = \dot{B} / B^\circ$ comes out to be (0.650) which indicates present covalent bond between metal ion and donor atom in the complex and these parameters are accepted for cobalt(II) octahedral complexes[21].

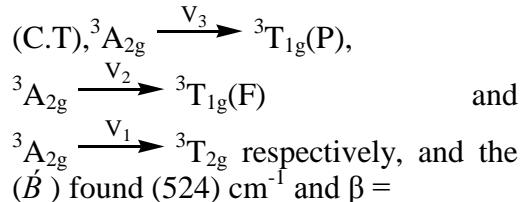

Fig. (6) Electronic spectrum of [CoLCl₂(H₂O)]

- [NiLCl₂(H₂O)] complex

The spectrum of the green complex exhibited the following absorptions at

(34482) cm⁻¹, (29411) cm⁻¹, (18450) cm⁻¹ and (13333) cm⁻¹, these bands are characteristic of octahedral

nickel(II)[22] complex and were assigned to the transitions

\bar{B} / B° comes out to be (0.50) which indicates present covalent bond between metal ion and donor atom in the complex.

- $[\text{CuLCl}_2(\text{H}_2\text{O})]$ complex

The spectrum of the blue complex of Cu(II) gave two bands at (47393) cm^{-1} and (33898) cm^{-1} caused by (C.T) transitions and only one absorption band was observed at (14903) cm^{-1} which assigned to ${}^2E_g \longrightarrow {}^2T_{2g}$

transition in octahedral structure[23],[24].

- $[\text{CaLCl}_2(\text{H}_2\text{O})]$, $[\text{ZnLCl}_2(\text{H}_2\text{O})]$, $[\text{CdLCl}_2(\text{H}_2\text{O})].5\text{H}_2\text{O}$ and $[\text{HgLCl}_2(\text{H}_2\text{O})]$

The yellow complexes $[\text{CaLCl}_2(\text{H}_2\text{O})]$, $[\text{ZnLCl}_2(\text{H}_2\text{O})]$, $[\text{CdLCl}_2(\text{H}_2\text{O})].5\text{H}_2\text{O}$ and $[\text{HgLCl}_2(\text{H}_2\text{O})]$ showed absorption bands at (33783) cm^{-1} , (33444) cm^{-1} , (33557) cm^{-1} and (39682) cm^{-1} respectively[25-28] attributed to internal ligand charge transfer.

According to these results, the structural formula of prepared complexes may be proposed in Fig. (7).

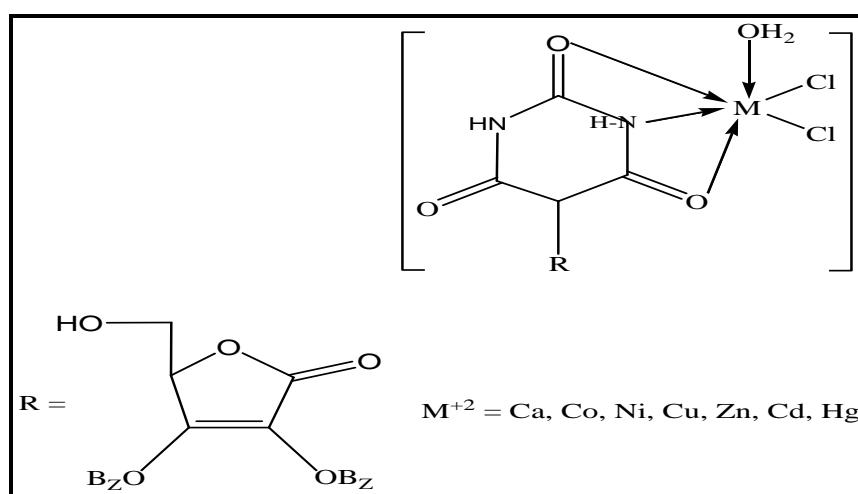

Fig. (7) the proposed structural formula of the complexes
