Abstract

The concepts of higher Bi-homomorphism and Jordan higher Bi-homomorphism have been introduced and studied the relation between Jordan and ordinary higher Bi-homomorphism also the concepts of Co-higher Bi-homomorphism and Co-Jordan higher Bi-homomorphism introduced and the relation between them in Banach algebra have also been studied.

Keywords: Banach algebra, Co-Homomorphism, Homomorphism, Jordan Homomorphism, Jordan Map.

Introduction:

Let $H$ and $G$ are complexes Banach algebras and let $\xi : H \rightarrow G$ be an additive map. Then $\xi$ is said $n$-homomorphism if for every $a_1, a_2, \ldots, a_n \in H$

$$\xi(a_1, a_2, \ldots, a_n) = \xi(a_1)\xi(a_2)\ldots\xi(a_n)$$

(1)

Hejazian Sh. and Mirzavaziri M in (1) studied the concept of $n$-homomorphism on complex algebra, 2-homomorphism being homomorphism, on this sense. We indicate to Bracic J., and Moslehian M.S in (2) on 3- homomorphism on certain attributes. Zelazko W in (3) introduced the definition of an m-Jordan homomorphism. An additive map $\xi$ between $A$ and $B$ which are Banach algebras is said to be $m$-Jordan homomorphism (for short m-JH) if

$$\xi(x^n) = (\xi(x))^m,$$

for all $x \in A$

(2)

A 2-Jordan homomorphism is said to be Jordan homomorphism. Every $m$-homomorphism is $m$-Jordan homomorphism. But generally the converse is false and it is true with some conditions. Zelazko W in (4) shows from Banach algebra into commutative semi simple Banach algebra that every Jordan homomorphism is a homomorphism. Zivari A in (5) refers to the reader to characterizations of 3-Jordan Homomorphism. Zelazko W in (3) shows that every $m$-Jordan homomorphism between commutative Banach algebras is an $m$-homomorphism for $\xi \{2,3,4\}$. An G., Ding Y. and Li J in (6)and Liu L in (7) some results about Jordan centralizers and Jordan derivations done.

In this article, let $U = A \times B$. Then $U$ with multiplication

$$(a, b)(x, y) = (ax, by), (a, b)(x, y) \in U$$

(3)

is Banach algebra. It is unital if and only if $A$ and $B$ are unital and it is commutative if and only if $A$ and $B$ are commutative and semi simple if its radical is zero also refer by $e$ to the unital element of $A$ and $B$. Suppose $D$ is complex Banach algebras. Bilinear map is a function $\xi : U \rightarrow D$ such that for any $aeA$ the map $b \mapsto \xi(a, b)$ is a map from $U$ to $D$, and for any $beU$ the map $a \mapsto \xi(a, b)$ is additive from $A$ to $D$.

Zivari A in (8) defined Jordan (resp., Bi-homomorphism) as follows

A bi-additive mapping $\delta$ is said Bi-homomorphism if for every $(a, b), (x, y)eA \times B$,

$$\delta(ax, by) = \delta(a, b)\delta(x, y),$$

And it is called Bi-Jordan homomorphism if

$$\delta(a^2, b^2) = (\delta(a, b))^2$$

Bi-Homomorphism be Jordan Bi-Homomorphism. In general the converse is not true Zivari A in(8) shows that the converse holds under some conditions. In this article, the concepts of Jordan (higher Bi-homomorphism) and the relation between them have been introduced and studied. An additive map $\delta$ between $A$ and $B$ which are Banach algebra is said to Co-homomorphism if $\delta(xy) = -\delta(x)\delta(y), x, yeA$, and it is called a Co-Jordan homomorphism $\delta(x^2) = -(\delta(x))^2$ for all $xeA$. Zivari A in (5) studied the relation between Co-Jordan homomorphism and Co-homomorphism under certain condition. In this article, the concepts
of Co- Bi- higher homomorphism and Co- Bi-
Jordan higher homomorphism and the relation
between them have been introduced and studied.

**Jordan Higher Bi- Homomorphism**

**Definition 2.1:**
Let $\{\delta_i\}_{i \in \mathbb{N}}$, $N$ is the natural number, be the family of bi- Linear map $\delta_i = R \times R \rightarrow R$, $(a, b), (x, y) \in U$, $U = R \times R$ is called higher bi-
homomorphism $\delta_n(a, b) = \sum_{i=1}^{n} \delta_i(a, b)$ and is said Jordan higher Bi-
homomorphism (JHHB, for short) if

$$\delta_n(a^2, b^2) = \sum_{i=1}^{n} (\delta_i(a, b))^2$$

**Lemma 2.2:** Suppose that $\delta: U \rightarrow R$ is a Jordan higher Bi-homomorphism. Then

1. $\delta_n(xy + yx, b^2) = \sum_{i=1}^{n} \delta_i(xy + yx, b^2)$
2. $\delta_n(2x^2 + 2y^2 + 2xy + e) = \sum_{i=1}^{n} \delta_i(2x^2 + 2y^2 + 2xy + e)$

**Proof:** It is straightforward

**Lemma 2.3:** Let $\delta$ be a Jordan higher Bi-
homomorphism. If $U$ commutative and unital , then

1. $\delta_n(xy, e) = \sum_{i=1}^{n} \delta_i(xy, e)$
2. $\delta_n(x + y, e) = \sum_{i=1}^{n} \delta_i(x + y, e)$

**Proof:** From lemma 2.2, if suppose that $y = a$ and use commutativity.

**Lemma 2.4:** Let $U$ be unital and let $\delta$ be a non-
trivial and non-empty family of Jordan higher Bi-
homomorphism (for short JHHB). Then $\delta(e, e) \neq 0$.

**Proof:** Since $\delta$ is a Jordan higher Bi-homomorphism. Then $\forall (a, b) \in U$, we get

$$\delta(a^2, b^2) = \sum_{i=1}^{n} (\delta_i(a, b))^2$$

Replacing $a$ by $x + e$, and $b$ by $y + e$ in (9)

$$\delta_n(a^2, b^2) = \sum_{i=1}^{n} (\delta_i(a, b))^2$$

By lemma 2.4, $\delta_n(e, e) \neq 0$, so (10) gives

$$\delta_n(e, e) = 1$$

**Theorem 2.5:** Let $U$ commutative and unital and $\delta$ be a Jordan Higher Bi-homomorphism from $U$ into a semi simple Banach commutative algebra $D$. Then $\delta$ is higher than Bi-homomorphism.

**Proof:** Let $D = \mathbb{C}$ and let $\delta = \{\delta_i\}_{i \in \mathbb{N}}, \delta_i: U \rightarrow \mathbb{C}$ be a Jordan higher Bi-homomorphism. So for every $(a, b) \in U$, we get

$$\delta_n(a^2, b^2) = \sum_{i=1}^{n} (\delta_i(a, b))^2$$

Replacing $a$ by $x + e$, and $b$ by $y + e$ in (9)

$$\delta_n(a^2, b^2) = \sum_{i=1}^{n} (\delta_i(a, b))^2$$

By (10) we get

$$\delta_n(e, e) = 1$$

Thus by (10), (11) and (12), we get

$$\delta_n(x, y) = \sum_{i=1}^{n} \delta_i(x, e) \delta_i(x, y)$$

$$\delta_n(xy, 2y) = \sum_{i=1}^{n} \delta_i(xy, e) \delta_i(x, y)$$

Suppose $U$ is commutative semi simple, $M(D)$ be the maximal ideal space of $D$, with each $f \in M(D)$, associate a function $\delta_f: U \rightarrow \mathbb{C}$ defined by $\delta_f(a, b) = f(\delta(a, b)), (a, b) \in U$.

**Co-Jordan Higher Bi-homomorphism**

**Definition 3.1:** A family $\delta = \{\delta_i\}, \delta_i: A \times A \rightarrow B$ where $A$ and $B$ are Banach algebra is called a Co Bi-
higher homomorphism if $\delta_n(ab, cd) = -\sum_{i=1}^{n} \delta_i(a, c) \delta_i(b, d)$

And is called a Co-Jordan higher Bi-
homomorphism if $a = b, c = d$.

**Theorem 3.2:** Suppose that $A$ is a Banach algebra
need not to be commutative. Then each Co-
Jordan higher Bi-homomorphism a Co-
higher Bi-homomorphism.

**Proof:** Suppose that $\delta$ is a Co-Jordan higher Bi-
homomorphism, So

$$\delta_n(a^2, c^2) = -\sum_{i=1}^{n} \delta_i(a, c) \delta_i(a, c) \forall a, c \in A$$

replaced $a$ by $a + b$ gives $\delta_n(ab + ba, c^2) = -2\sum_{i=1}^{n} \delta_i(a, c^2) \delta_i(b, c^2) \forall a, b, c \in A$ then by (18),
