Density Functional Theory (DFT) method of the type (B3LYP) and a Gaussian basis set (6-311G) were applied for calculating the vibration frequencies and absorption intensities for normal coordinates (3N-6) at the equilibrium geometry of the Di and Tetra-rings layer (6, 0) zigzag single wall carbon nanotubes (SWCNTs) by using Gaussian-09 program. Both were found to have the same symmetry of  $D_{6d}$  point group with C-C bond alternation in all tube rings (for axial bonds, which are the vertical C-Ca bonds in rings layer and for circumferential bonds C-Cc in the outer and mid rings bonds). Assignments of the modes of vibration IR active and inactive vibration frequencies (symmetric and asymmetric modes) based on the image modes applied by the Gaussian 09 display. The whole relations for the vibration modes were also done including vCH stretching, vC-C stretching,  $\delta$ CH,  $\delta$ ring ( $\delta$ C-C-C) deformation in plane of the molecule) and  $\gamma$ CH,  $\gamma$ ring ( $\gamma$ C-C-C) deformation out of plane of the molecule. The assignment also included modes of puckering, breathing and clock-anticlockwise bending vibrations.

**Key word:** Di and Tetra-rings Layer, IR Absorption Intensities, Modes of vibration, Normal coordinates, SWCNT, Vibration frequencies.

**Introduction:**

The vibration behavior of carbon nanotubes (CNTs) has been extensively investigated due to their importance in Nano-electro-mechanical systems and Nano sensor application. Raman spectroscopy is a technique widely used to study the vibrational modes of CNTs and characterize their structures. The Raman spectrum analysis focuses on the low-frequency radial breathing modes with less than  $300\text{ cm}^{-1}$ , which are very sensitive to the nanotube diameters (1-4). Since experiments at the Nano scale are extremely difficult to conduct, theoretical modeling of the mechanical response of CNTs has been carried out (5,6). They are shown graphically and have been compared with those available in the literature. Vibration characteristics of CNTs have been widely examined for the last fifteen years. Such characteristics are studied by thin shell (7), beam (8) and ring (9) theories of continuum models (10). Theoretical study of CNTs reflects those mechanical aspects which are difficult to observe by experimental and atomistic simulation methodologies. A study of their free vibration is an important phenomenon in dynamical science. These characteristics are impressed by their material properties.

These tubes are placed in various physical environments and subject to various constraints. Influence of these constraints is investigated on vibration characteristics of single-walled carbon nanotubes (SWCNTs). Carbon nanotubes (CNTs) have a vast field of applications in material strength analysis. Some worth-mentioning fields are emanation panel spectacle, chemical sensing, drug deliverance, and Nano-electronics. Having a good utilization of these tubes in fields of science and industry, however, their mechanical behavior demands more understanding in this aspect of study. Use of these tubes had found in the fields of electrical and chemical engineering and biological sciences. An experimental aspect of vibration problems of (SWCNTs) have also been interest of researchers along with analytical study of information got through it. Three fundamental techniques are utilized to generate them, which include molecular dynamic (MD) simulations, atomistic-based modeling and the continuum approach. Mostly the continuum method is applied to fabricate them. Since these are material objects can get deformed in practical situations, so their buckling and vibration investigations are fundamental problems in CNTs motions at non-mechanical levels. Lordi and Yao (11) applied molecular dynamic simulations to determine

vibration frequencies of SWCNTs using the universal force field method.

In the recent studies we calculated and studied theoretically, the complete assignments for vibration frequencies and absorption intensities of (3N-6) for monoring segments of CNTs (linear, angular and angular-chiral) (12,13) and for the (6,0) linear (zigzag Tri-rings layer) SWCNT. Comparisons were done for the vibration frequencies of monoring SWCNTs with different diameters (14), for construction units of (6,0) (15) armchair and zigzag SWCNTs (16). In this work, the theoretical calculations of the Density Functional Theory quantum mechanical method (DFT) (17), is applied, in the form of the B3LYP approach (18-19) and the 6-311G Gaussian bases set (20) is used, for calculating vibration frequencies and normal modes of vibration (3N-6) for Di and Tetra-rings layer (6, 0) linear (zigzag) SWCNTs

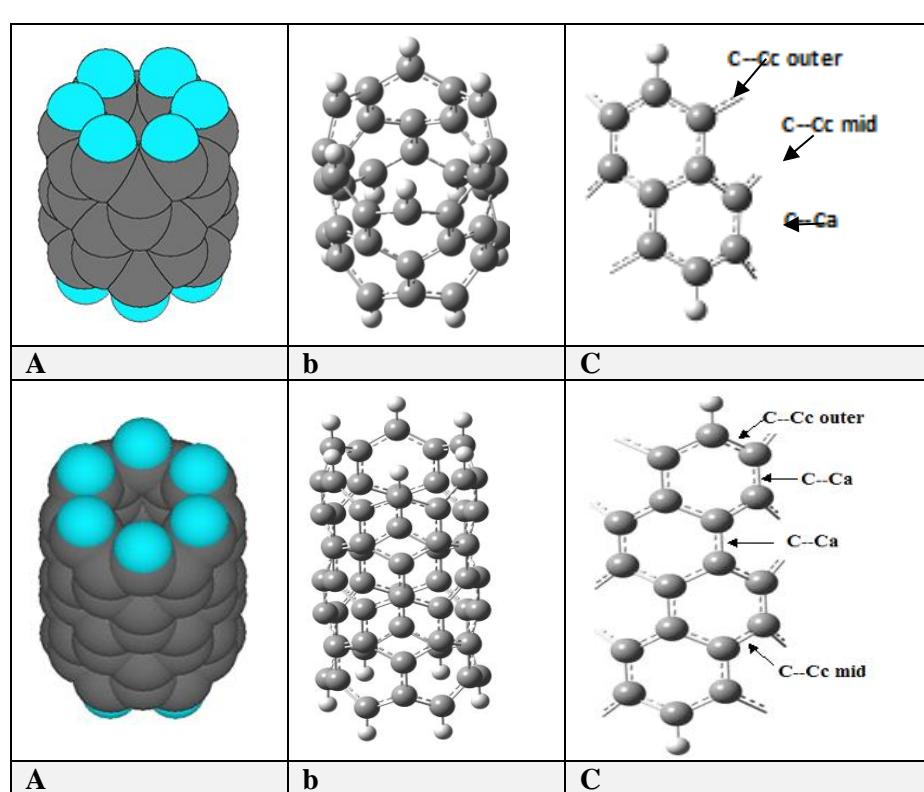

### Computational Details

DFT (6-311G/ B3LYP) calculations were performed with complete geometrical optimization, for Di and Tetra-RL (6, 0) linear (zigzag) SWCNTs using Gaussian-09 software package (21). The

calculations were used to analyze and describe the characteristics of the structural nature of the modes of vibration with IR absorption intensities for Di and Tetra-rings layer zigzag SWCNTs.

### Results and Discussion:

The classifications of carbon nanotubes Di and Tetra-rings layers can be described as SWNTs resembling rolling graphene sheet into a cylindrical structure. They are uniquely defined by specifying the coordinates of the smallest folding vector ( $n, 0$ ) linear zigzag SWCNTs (22), composing of linear numbers of benzene ring molecules. So Di and Tetra rings layer SWCNTs are composed of linear six members of benzene aromatic rings in each of the two or four rings layer respectively. DFT (B3LYP/6-311G) calculations of the equilibrium geometries, shows  $D_{6d}$  symmetry point group for both (23). The geometric parameters were defined, distinguished between axial bonds (C-Ca), outer, and mid circumferential bonds (C-Cc). Figure 1, shows the space filling; minimize geometry and repetitive sections of the two types of bonds in Di and Tetra-rings layer zigzag CNTs due to their  $D_{6d}$  symmetry.

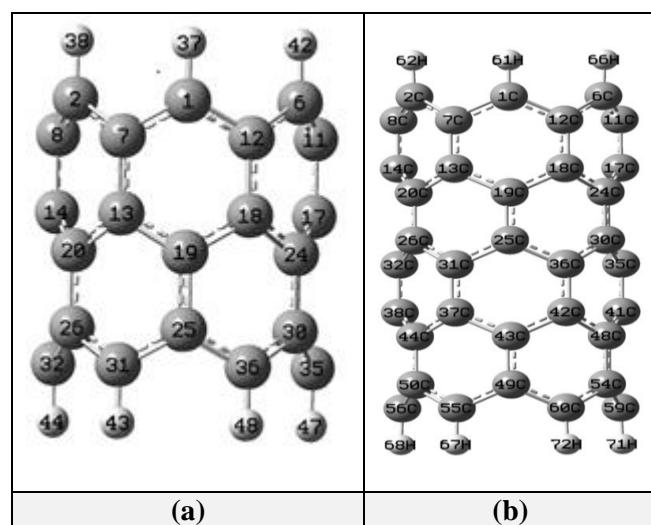

**Figure 1.** The space filling (a), minimize geometry (b), repetitive sections of bonds and angles for Di and Tetra-rings-layer (6, 0) zigzag (SWCNTs) according to the  $D_{6d}$  point group (c).

All C-C bonds were found to be alternated in the rings tube according to  $D_{6d}$  point group. The C-C bonds at the optimize zigzag Di-rings-layer SWCNTs were all being as conjugated double

bonds. Tables 1a, 1b show that (C-Cc) bonds length for both Di and Tetra-rings layer SWCNT were being longer (weaker with lower force constant) on going from outer to mid bonds in Di rings layer or

on going to center bonds in (Tetra rings layer). The (the reverse were shown for the axial bonds (C--Ca)(12,15-16). Also the Gaussian 09 program have been employed to computesome physical properties such as a standard heat of formation  $\Delta H_f$ , dipole moment  $\mu$  which is equal to zero Debye, the HOMO (Highest Occupied Molecular Orbital) and LUMO (Lowest Unoccupied Molecular Orbital).  $E_{HOMO}$  is often associated with the ability of donating electrons. High values of  $E_{HOMO}$  likely indicate a tendency for donating electrons to appropriate acceptors with low energy and empty molecular orbital. Similarly,  $E_{LUMO}$  represents the ability of the molecule to accept electrons. The lower value of  $E_{LUMO}$  suggests high probability for accepting electrons (12). The low value of  $\Delta E_{HOMO-LUMO}$  leads to ensure better physical properties of electrical conductivity (15-16, 24-25). Figure 2, shows the numbering of the atoms of (6, 0) Di and Tetra-ring layers (zigzag) SWCNTs respectively.

**Figure 2. Numbering of atoms for (6, 0) Di (a) and (b) Tetra-rings layer (zigzag) SWCNT.**

The calculation of the geometric structures and some physical properties for the Di and Tetra-rings layer SWCNT at the equilibrium geometry, are listed in Tables 1a, 1b respectively.

**Table 1a. DFT calculations for the geometrical structure and some physical properties of the Di-rings-layer SWCNT.**

$$\Delta E_g = E_{LUMO} - E_{HOMO}$$

The finger print vibrations (basic vibrations) of Di and Tetra-rings layer (Di and Tetra-RL) SWCNTs were calculated and assigned such as breathing, puckering, elongation and clock-anti-clockwise bending or deformation modes. Active vibrations cause a change in its geometric structure. Measurements were made to study the effect of curvature distortion on the electronic properties of carbon nanotubes (26-29).

For a normal mode of vibration to be active in infrared, there must be a change in the dipole moment of the molecule during the vibration process (during the vibration motion of a molecule, a regular fluctuation occurs in the dipole moment, and the established field can interact with the radiation-related electric field). In order to absorb the infrared, radiation, a molecule must undergo a net change in its dipole moment due to its own vibration movements (30).

### Vibration Frequencies and Absorption Intensities of the Calculated SWCNTs

Geometrical optimizations have been performed at the calculations of (DFT/B3LYP) to evaluate the vibration frequencies and Infra-Red (IR) absorption intensities for of (6,0) zigzag Di and Tetra-RL. Equilibrium geometry of ( $D_{6d}$ ) point group makes the (6,0) Di and Tetra-rings layer zigzag SWCNT undergo 24 symmetry operations ( $E$ ,  $2S_{12}$ ,  $2C_6$ ,  $2S_4$ ,  $2C_3$ ,  $2S^5_{12}$ ,  $C_2$ ,  $6C'_6$ ,  $6\bar{6}_d$ ) (23, 30).

#### -Vibration Frequencies Assignment of Di-Rings Layer (6, 0) Zigzag SWCNT

The Di-RL zigzag SWCNT posses 138 fundamental vibrations. Inspection of its irreducible representations, as defined by the symmetry character table (23), results in the following modes of vibration;

$$\Gamma_{\text{vibration}} = \Gamma_{\text{total}} - (\Gamma_{\text{rotation}} + \Gamma_{\text{translation}}) = 3N - 6 = 3 \times 48 - 6 = 144 - 6 = 138 = 8A_1 + 4B_1 + 3A_2 + 7B_2 + 11E_1 + 12E_2 + 12E_3 + 12E_4 + 11E_5$$

#### - Symmetric to the Plane (of the Molecule)

There are 18 IR active modes of vibration ( $7B_2 + 11E_1$ ), and 31 Raman active modes of vibration ( $8A_1$  (polarized) +  $12E_2$  (depolarized) +  $11E_5$  (depolarized) (22, 25), can be assigned as follows:

#### - vCH Stretching Vibrations

These are 12 CH stretching vibrations according to number of (CH) bonds. The range of frequency values is ( $3028-3041\text{cm}^{-1}$ ), showing the following correlation:

$$v_{\text{sym}} \text{ CH str.} (3041 \text{ cm}^{-1}) (A_1) > v_{\text{asym}} \text{ CH str.} (3040 \text{ cm}^{-1}) (B_2)$$

The highest intensity is **120.444 km/mol** due to  $v_{16}(3040 \text{ cm}^{-1}) (B_2)$ .

#### - v(C--C) Stretching Vibrations

The range of the calculated (C--C) stretching vibration frequencies is ( $1323-1555 \text{ cm}^{-1}$ ), shown in the following relations;

$$v_{\text{sym}} \text{ (C--C str.)} (1555 \text{ cm}^{-1}) \text{ (axial.)} (A_1) > v_{\text{asym}} \text{ (C--C str.)} (1525 \text{ cm}^{-1}) \text{ (axial.)} (E_1)$$

$$v_{\text{sym}} \text{ (C--C str.)} (1555 \text{ cm}^{-1}) \text{ (axial.)} (A_1) > v_{\text{asym}} \text{ (C--C str.)} (1513 \text{ cm}^{-1}) \text{ (circum.)} (E_5)$$

In general:  $v_{\text{sym}} \text{ (C--C str.)} > v_{\text{asym}} \text{ (C--Cstr.)}$

#### - vRing (C--C--C) Stretching Vibrations

The vibration of these modes are not located at definite C atoms like  $v(CC)$  as could be seen from the atomic displacement vectors. According to their assignment, they fall in the range of ( $1198-1468 \text{ cm}^{-1}$ ).

$$v_{\text{asym}} \text{ (C--C--C str.)} (1468 \text{ cm}^{-1}) \text{ (axial.)} (B_2) > v_{\text{asym}} \text{ (C--C--C str.)} (1360 \text{ cm}^{-1}) \text{ (circum.)} (E_3)$$

The highest intensity is **4.299 km/mol** for  $v_{17}$  ( $1468 \text{ cm}^{-1}$ ) ( $B_2$ ).

#### - $\delta$ CH in-Plane (of the tube) CH Deformation Vibrations

Their displacement vectors are mainly located at the corresponding H atoms. The range of the calculated frequency values is ( $1152-1440 \text{ cm}^{-1}$ ).

$$(\delta\text{CH})_{\text{asym}} \text{ scissoring} (1440 \text{ cm}^{-1}) (E_3) > (\delta\text{CH})_{\text{asym}} \text{ (clock-anticlockwise) (rocking)} (1418 \text{ cm}^{-1}) (A_2)$$

The highest intensity is **16.451 km/mol** due to  $v_{27,28}$  ( $1367 \text{ cm}^{-1}$ ) ( $E_1$ ).

#### - In Plane (of the Tube) Deformation Vibrations ( $\delta$ C--C--C)

The deformation of smaller values is ( $\delta$ C--C--C) vibrations. According to their assignment, they were fallen in the range of ( $328-1302 \text{ cm}^{-1}$ ). These modes include the expected clock and anticlockwise vibration motions, also showing the following relations;

$$(\delta\text{C--C--C})_{\text{sym}} \text{ (elongation)} (1302 \text{ cm}^{-1}) (A_1) > (\delta\text{C--C--C})_{\text{asym}} \text{ (circum.)} (1262 \text{ cm}^{-1}) (E_1)$$

The highest intensity is **34.914 km/mol** for  $v_{21}$  ( $580 \text{ cm}^{-1}$ ) ( $B_2$ ).

#### - Out of Plane (of the Tube) Deformation Vibration Frequencies ( $\gamma$ CH)

The range of the ( $\gamma$ CH) out of plane vibrations frequency is ( $436-931 \text{ cm}^{-1}$ ). The following relations hold to;

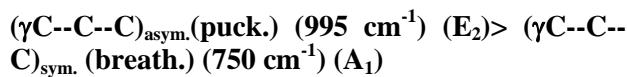

$$(\gamma\text{CH})_{\text{asym}} (931 \text{ cm}^{-1}) \text{ (wagging)} (B_2) > (\gamma\text{CH})_{\text{asym}} (928 \text{ cm}^{-1}) \text{ (wagging)} (A_1)$$

$$(\gamma\text{CH})_{\text{asym}} (931 \text{ cm}^{-1}) \text{ (wagging)} (B_2) > (\gamma\text{CH})_{\text{asym}} (867 \text{ cm}^{-1}) \text{ (twisting)} (E_2)$$

The highest intensity is **391.477 km/mol** due to  $v_{33,34}$  ( $894 \text{ cm}^{-1}$ ) ( $E_1$ ).

**-  $\gamma$ Ring Out of Plane (of the Tube) Deformation Vibrations ( $\gamma$ C--C--C)**

The range of the vibrations frequency values for the ring out of plane ( $\gamma$ C--C--C) is (144-995 cm<sup>-1</sup>). The modes include deformations, puckering as well as breathing vibrations of the whole ring. The relation of the asymmetric to the symmetric modes for the zigzag molecule is viewed in the following relation;

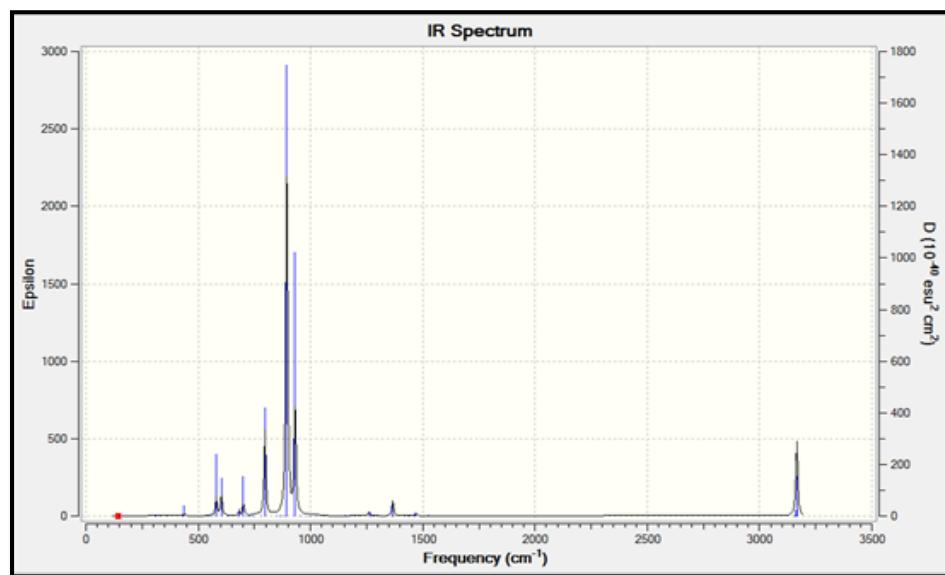

The highest intensity is **83.668km/mol** due to  $\nu_{35, 36}$  (797 cm<sup>-1</sup>) (E<sub>1</sub>).

Table 2, shows the assignment of (3N-6) vibration frequencies and IR active absorption intensities of the Di-RL (6, 0) zigzag SWCNT. Figure 3, shows the IR spectrum of the Di-RL SWCNT as calculated by DFT method. Figure 4 shows the images of some modes of vibration for Di-RL SWCNT.

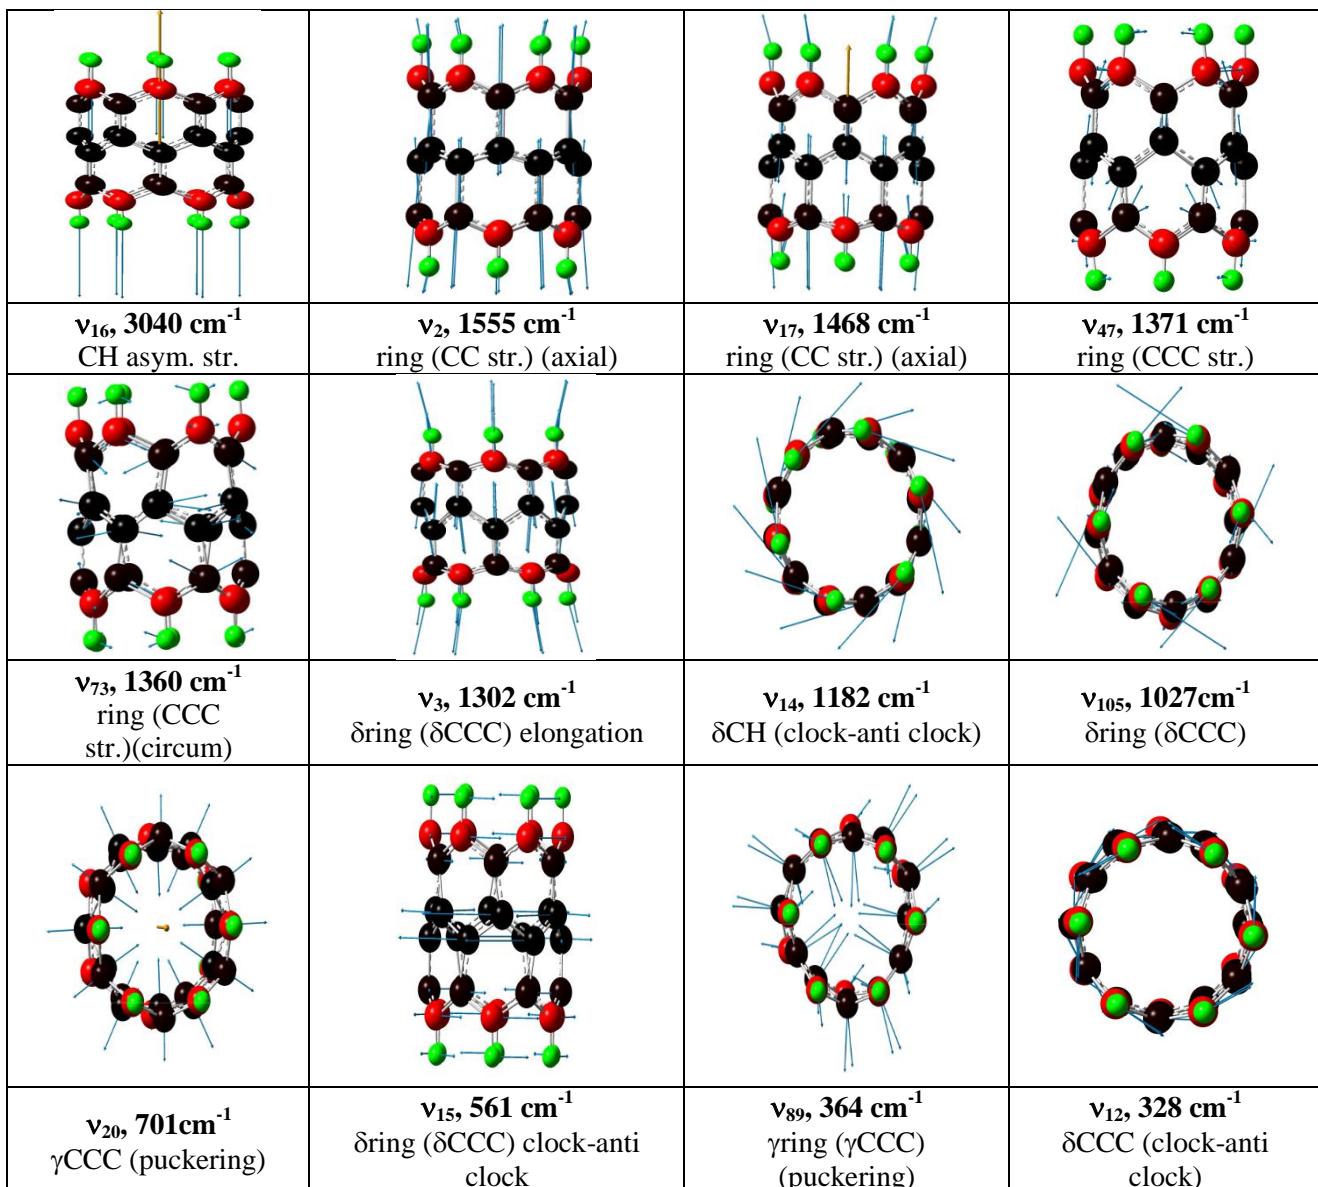

**Table 2. Vibration frequencies assignment of (3N-6) and absorption intensities of the active IR modes for the Di-RL (6,0) zigzag SWCNT.**

**Figure 3.** IR spectrum of Di-rings layer SWCNT as calculated applying DFT method.

**Figure 4.** Images of some modes of vibration for the calculated Di-RL (6, 0) zigzag SWCNT using, Gaussian 09 program.

### - Vibration Frequency Assignment for the Tetra Rings-layer (6,0) Zigzag SWCNT ( $C_{60}H_{12}$ )

The Tetra-ring layers zigzag SWCNT posses 210 fundamental vibrations. Inspection of its irreducible representations, as defined by the symmetry character table (23).The results were shown for the following modes of vibration;

$$\Gamma_{\text{vibration}} = \Gamma_{\text{total}} - (\Gamma_{\text{rotation}} + \Gamma_{\text{translation}}) = 3N-6 = 216-6 = 210 = 12A_1 + B_1 + 5A_2 + 11B_2 + 17E_1 + 18E_2 + 18E_3 + 18E_4 + 17E_5$$

These are 75 modes of vibration in number, of which 47 are Raman active ( $12A_1$  (polarized) +  $18E_2$  (depolarized) + $17E_5$  (depolarized), and 28 IR active ( $11B_2 + 17E_1$ ).

#### - $\nu CH$ Stretching Vibrations

There are 12 CH stretching vibrations according to number of CH bonds. The range of the frequency values is ( $3001-3050\text{cm}^{-1}$ ), showing the following correlations:

$$\nu_{\text{sym}}.CH \text{ str.}(3050.17 \text{ cm}^{-1}) (A_1) > \nu_{\text{asym}}.CH \text{ str.}(3050.04 \text{ cm}^{-1}) (B_2)$$

The highest intensity is  $65.390 \text{ km/mol}$  due to  $\nu_{24}(3050.04 \text{ cm}^{-1}) (B_2)$ .

In general: $\nu_{\text{sym}}.CH \text{ str.} > \nu_{\text{asym}}.CH \text{ str.}$

#### - $\nu(C-C)$ Stretching Vibrations

The range of the calculated C-C stretching vibration is ( $1260-1573\text{cm}^{-1}$ ), shown in the following correlations;

$$\nu_{\text{sym}}.(C-C \text{ str.})(1573 \text{ cm}^{-1}) \text{ (axial.)} (A_1) > \nu_{\text{asym}}.(C-C \text{ str.})(1562 \text{ cm}^{-1}) \text{ (axial.)} (B_2)$$

$$\nu_{\text{sym}}.(C-C \text{ str.})(1573 \text{ cm}^{-1}) \text{ (axial.)} (A_1) > \nu_{\text{asym}}.(C-C \text{ str.})(1513 \text{ cm}^{-1}) \text{ (circum.)} (E_5)$$

$$\nu_{\text{sym}}.(C-C \text{ str.})(1573 \text{ cm}^{-1}) \text{ (axial.) (mid rings)} (A_1) > \nu_{\text{sym}}.(C-C \text{ str.})(1527 \text{ cm}^{-1}) \text{ (axial) (outer rings)} (A_1)$$

In general:  $\nu_{\text{sym}}.(C-C \text{ str.}) > \nu_{\text{asym}}.(C-C \text{ str.})$

The highest intensity is  $584.722 \text{ km/mol}$  due to  $\nu_{44}(1404 \text{ cm}^{-1}) (E_1)$ .

#### - $\nu Ring$ (C-C-C) Stretching Vibrations

The vibration of these modes are not located at definite C atoms like  $\nu(CC)$  as could be seen from the atomic displacement vectors, Figure 2. According to their assignment, they were fallen in the range of ( $1216-1516 \text{ cm}^{-1}$ ).

$$\nu_{\text{asym}}.(C-C-C \text{ str.})(1516 \text{ cm}^{-1}) \text{ (axial)} (E_5) > \nu_{\text{asym}}.(C-C-C \text{ str.})(1513 \text{ cm}^{-1}) \text{ (circum.)} (E_5)$$

The highest intensity is  $62.722 \text{ km/mol}$  due to  $\nu_{40,41}(1478 \text{ cm}^{-1}) (E_1)$ .

#### In Plane (of the Tube) CH Deformation Vibrations ( $\delta CH$ )

Their displacement vectors are mainly located at the corresponding H atoms. The range of the calculated frequency values is ( $1055-1443 \text{ cm}^{-1}$ ).

$(\delta CH)_{\text{asym. scissoring}}(1443 \text{ cm}^{-1}) (E_3) > (\delta CH)_{\text{asym. clock-anticlock}}(1437 \text{ cm}^{-1}) (B_1)$   
 $(\delta CH)_{\text{asym. scissoring}}(1494 \text{ cm}^{-1}) (E_4) > (\delta CH)_{\text{asym. rocking}}(1256 \text{ cm}^{-1}) (E_1)$

The highest intensity is  $17.708 \text{ km/mol}$  due to  $\nu_{48,49}(1256 \text{ cm}^{-1}) (E_1)$ .

#### In Plane (of the Tube) Deformation Vibrations ( $\delta C-C-C$ )

The ( $\delta C-C-C$ ) vibrations are of smaller values than  $\delta CH$ . According to their assignment, they were fallen in the range ( $209-1297 \text{ cm}^{-1}$ ). These mode include the expected clock and anticlockwise, elongation vibration motions, also showing the following relations;

$$(\delta C-C-C)_{\text{sym.}} \text{ (elongation)}(1297 \text{ cm}^{-1}) (A_1) > (\delta C-C-C)_{\text{asym.}} \text{ (elongation)}(1150 \text{ cm}^{-1}) (B_2)$$

The highest intensity is  $5.039 \text{ km/mol}$  due to  $\nu_{30}(650 \text{ cm}^{-1}) (B_2)$ .

#### Out of Plane (of the Tube) Deformation Vibration Frequencies ( $\gamma CH$ )

-The range of the ( $\gamma CH$ ) vibration frequencies is ( $798-904 \text{ cm}^{-1}$ ). The following relations hold too;

$$(\gamma CH)_{\text{sym.}}(904 \text{ cm}^{-1}) \text{ (wagging)} (A_1) > (\gamma CH)_{\text{asym.}}(893 \text{ cm}^{-1}) \text{ (wagging)} (B_2)$$

$$(\gamma CH)_{\text{sym.}}(904 \text{ cm}^{-1}) \text{ (wagging)} (A_1) > (\gamma CH)_{\text{asym.}}(856 \text{ cm}^{-1}) \text{ (twisting)} (E_4)$$

The highest intensity is  $179.346 \text{ km/mol}$  due to  $\nu_{54,55}(835 \text{ cm}^{-1}) (E_1)$ .

#### - $\gamma$ Ring out of Plane (of the Tube) Deformation Vibrations ( $\gamma C-C-C$ )

The range of the vibration frequencies for the ( $\gamma C-C-C$ ) is ( $152-819 \text{ cm}^{-1}$ ). The modes include breathing, and puckering deformation modes of the whole ring. The relation of asymmetric to symmetric modes is viewed in the following relation;

$$(\gamma C-C-C)_{\text{asym.}} \text{ (puckering)}(819 \text{ cm}^{-1}) (E_1) > (\gamma C-C-C)_{\text{sym.}} \text{ (breathing)}(727 \text{ cm}^{-1}) (A_1)$$

The highest intensity is  $100.250 \text{ km/mol}$  due to  $\nu_{33}(461 \text{ cm}^{-1}) (B_2)$ .

Table 3 shows the vibration frequencies assignment (3N-6) and absorption intensities of active IR absorption intensities of the Tetra-RLSWCNT.

Figure 5 shows the IR spectrum for the Tetra-RLSWCNT as calculated applying DFT method.

Figure 6 shows the images of some vibration modes for the calculated Tetra-RL using Gaussian 09 program.

**Table 3.** Vibration frequencies assignment (3N-6) and absorption intensities of the active IR modes for the Tetra-RL (6,0) zigzag SWCNT.

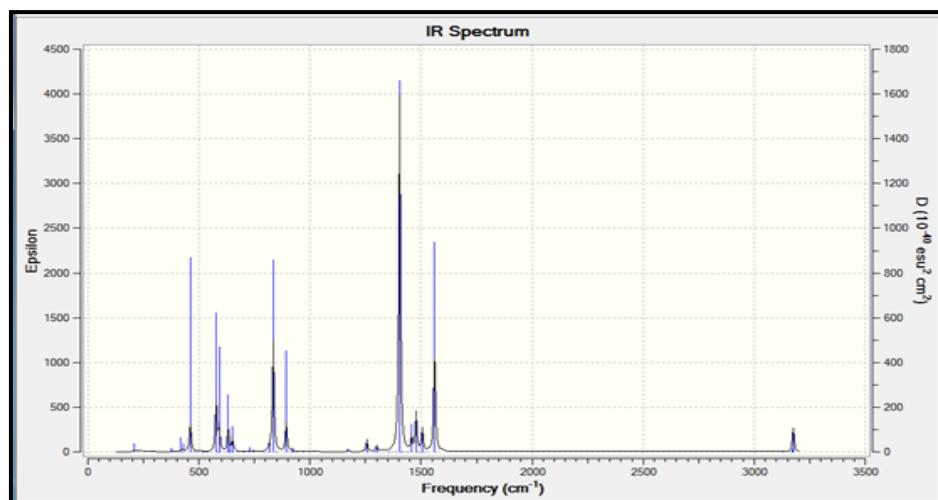

Figure 5. IR spectrum for Tetra-RL SWCNT as calculated applying DFT method.

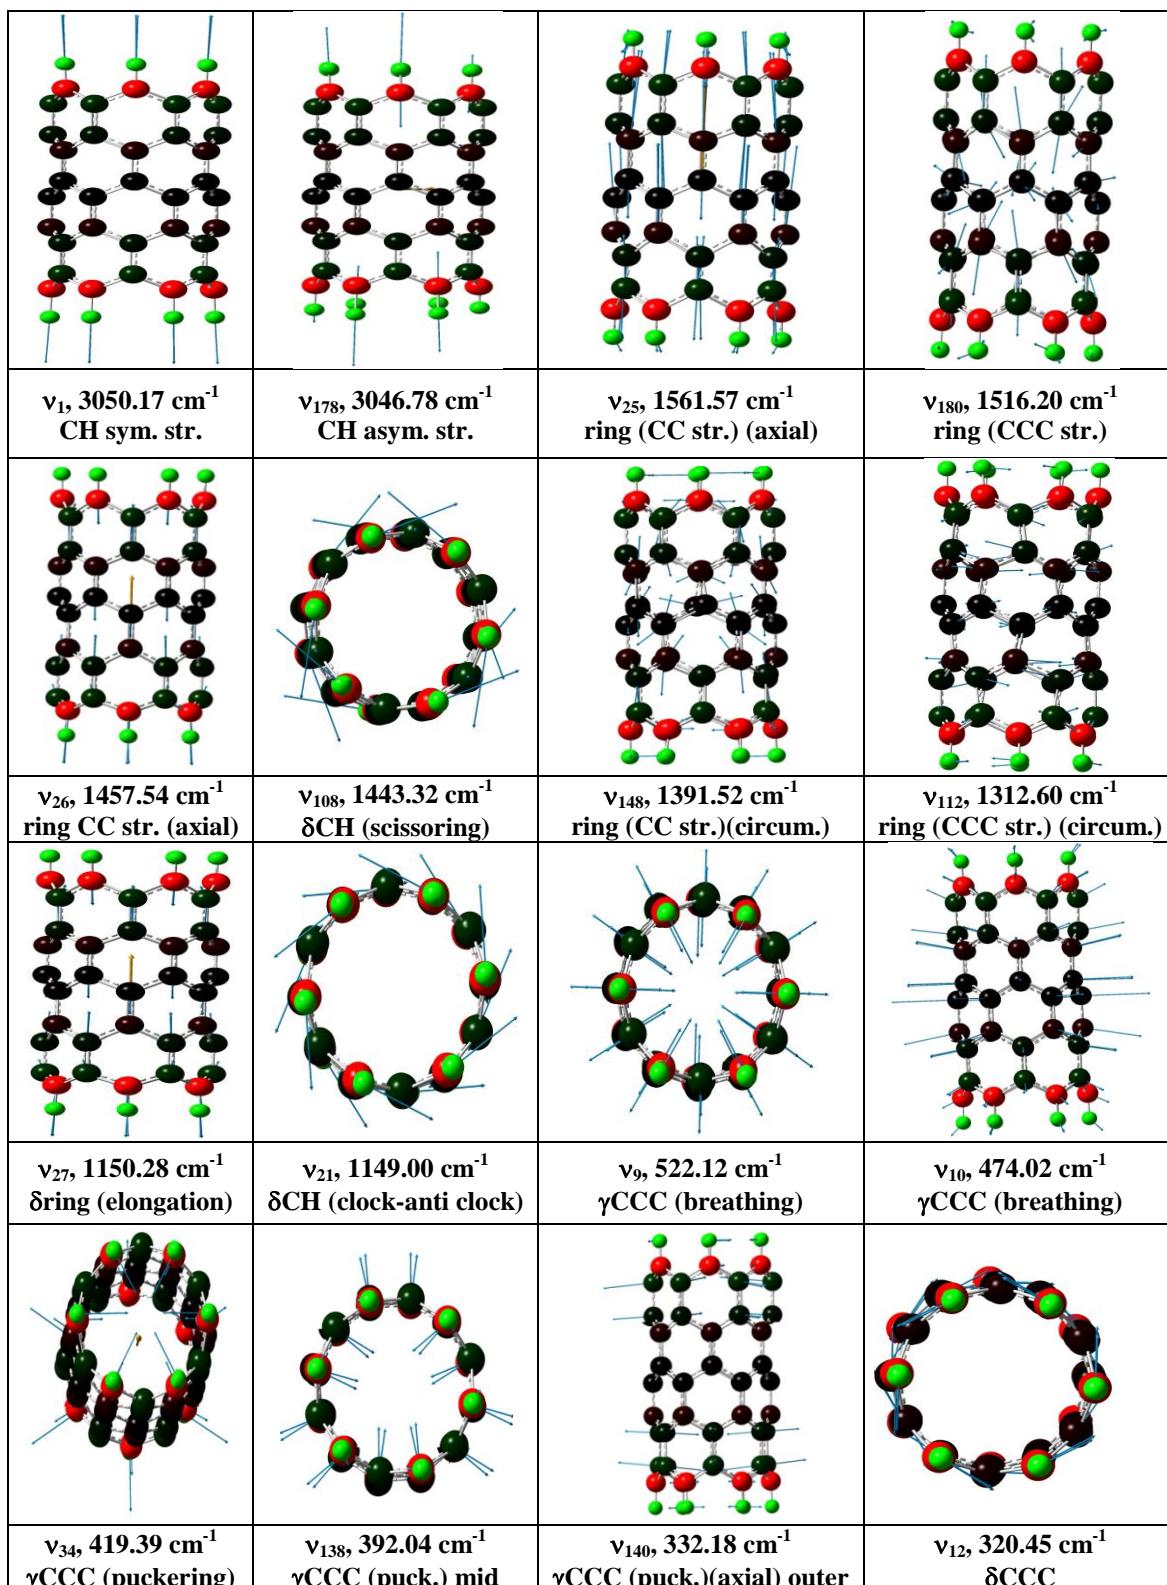

Figure 6. Images of some modes of vibration for the calculated Tetra-RL (6, 0) zigzag SWCNT using Gaussian 09 program.

### Conclusion:

1-Quantum mechanical calculation method DFT (6-311G/B3LYP) was carried out for optimization of Di and Tetra-rings layers of (6,0) zigzag SWCNTs. Both were showed  $D_{6d}$  point group. Gaussian 09 program was used to investigate the assignment of (3N-6) mode of vibrations (IR active and Raman active) at minimize geometries.

- 2- Comparison of the geometry, physical properties, vibration frequency modes were done for the even-rings layer Di and Tetra-RL SWCNTs.
- 3-The finger print vibrations (basic vibrations) of Di and Tetra RLSWCNTs were measured and completely assigned such as  $\delta\text{C--C--C}$  (elongation and clock-anti-clockwise), ( $\gamma\text{CCC}$ ) (puckering, breathing),  $\delta\text{CH}$  (clock-anti clock, scissoring, rocking), and  $\gamma\text{CH}$

(wagging, twisting) deformation modes, which are directly related to the viability electronic conductivity.

### Conflicts of Interest: None.

## **الخلاصة:**

تضمن البحث استخدام طريقة حساب نظرية دوال الكثافة DFT نوع B3LYP (G-311G) و باستخدام برنامج Gaussian-09 في حساب الشكل الهندسي التوازني لانبوبي نانوكربون نوع زكراك ثنائي و رباعي الطبقه الحلقية اللذان وجد امتلاكمها لنفس التمايل وفق نظرية المجموعة  $D_{6d}$  وبتعاقب جميع اوامر CC سواء كانت الاوامر العمودية C-Ca (باتجاه المحور z) أو الاوامر المحيطية C-Cc (الحافة الخارجية و لوسط الانبوب). تم تصنيف ترددات اهتزاز طيف الاشعة تحت الحمراء وبعدد (3N-6) وتشخيصها تكافؤيا و تمايليا اعتمادا على اشكال الانماط التي تم الحصول عليها باستخدام عرض برنامج Gaussian 09. وتم ايجاد جميع العلاقات المتعلقة بالانماط المختلفة كترددات مط  $\nu$ CH و ترددات الانحناء  $\delta$ CH و  $\delta$ C-C-C و  $\gamma$ C-C-C و  $\gamma$ C-C-C، المتضمنة الحركات النفسية والابتعاجية الانحنائية باتجاه ويعكس اتجاه عقرب الساعة.

**الكلمات مفاهيمية:** أنيوب ثانية، رباعي، الطبقية، شدة الامتصاص، الادهانات المتعمدة، الانساط الاهتزازية، SWCNT، ترددات الاهتزاز،
